

materimaging Breast Imaging

care, compassion and dedication

materimaging is dedicated to providing you with the highest standard of personalised care

Mater Imaging provides a caring, compassionate and extensive breast imaging service. Mater Imaging's highly skilled staff are speciality trained, our breast imaging technology is the latest in Digital Imaging and your results are reported on site by a specialised breast radiologist. We perform a wide range of breast imaging services including mammography, breast ultrasound, breast procedures and breast MRI.

3D Mammography, Breast Tomosynthesis, is the latest technology now available for breast imaging. **Breast Tomosynthesis** is very similar to a regular 2D mammogram only it creates very thin images of your breast from multiple angles and then renders this into a 3D image. This provides superior depiction of breast tissue enabling more accurate differentiation between normal and abnormal breast tissue and allowing us to determine better what further investigation may be needed. *Mammogram Preparation:* Please ensure all deodorant and talcum powder is removed prior to your scan. Please bring previous films

Ultrasound is recommended for investigation of breast symptoms in women under 25 years of age and is used in conjunction with mammography for women over the age of 35. No preparation is required for this ultrasound.

Your health is our priority
